

TaskFlow Product & Integrations Guide

Account management, security, data handling, and third-party integration reference for TaskFlow workspaces.

1. Account & Team Management

1.1 Adding Team Members

Go to Settings > Team > Invite Member, enter their email, and select a role (Admin, Editor, or Viewer). They'll receive an email invite that expires after 7 days.

1.2 Permissions

Board-level permissions can be set per member under Board Settings > Permissions. Permission changes can take up to 2 minutes to propagate; if a permission reverts immediately, this is a known sync issue currently being tracked by engineering and should be escalated rather than treated as user error.

1.3 Two-Factor Authentication

Enable 2FA under Settings > Security > Two-Factor Authentication. Supports authenticator apps (Google Authenticator, Authy) via QR code setup.

1.4 Data Export

Full workspace export (all boards, all data) is available under Settings > Data > Export Workspace, in CSV or JSON format. Exports remain available for 30 days after account cancellation before data is permanently deleted.

1.5 Password Reset Issues

If a password reset link isn't working, first check for multiple reset emails, since only the most recent link is valid. If login still fails after using the newest link, this may indicate an account lockout from repeated failed attempts, which requires escalation to support for a manual unlock.

2. Integrations Troubleshooting

2.1 Zapier

If Zapier automations stop syncing without an error, the most common cause is an expired OAuth token. Reconnect the integration under Settings > Integrations > Zapier > Reconnect, which resolves the issue in most cases.

2.2 Slack Notifications

If Slack notifications stop arriving, check Settings > Integrations > Slack to confirm the connection is still active, since Slack tokens can expire after workspace admin changes on Slack's side. Reconnecting resolves this in most cases; if not, the issue may be on Slack's delivery side and should be escalated.

2.3 API Rate Limits

- Free plan: 100 requests/hour
- Pro plan: 1,000 requests/hour
- Business plan: 10,000 requests/hour

Rate limit headers are included in every API response (X-RateLimit-Remaining) so usage can be monitored in real time.
